## **LAB RECORD**

### **Computer Network Lab (23CS5PCCON)**

*Submitted by*

**Tanish M V(1BM22CS302)**

*in partial fulfillment for the award of the degree of*

**BACHELOR OF ENGINEERING  
in  
COMPUTER SCIENCE AND ENGINEERING**

**B.M.S. COLLEGE OF ENGINEERING**

**(Autonomous Institution under VTU)**

**BENGALURU-560019**

**Academic Year 2024-25 (odd)**

# B.M.S. College of Engineering

Bull Temple Road, Bangalore 560019

(Affiliated To Visvesvaraya Technological University, Belgaum)

## Department of Computer Science and Engineering

### CERTIFICATE

This is to certify that the Lab work entitled “ Computer Network (23CS5PCCON)” carried out by **Tanish M V(1BM22CS302)**, who is a bonafide student of **B.M.S. College of Engineering**. It is in partial fulfilment for the award of **Bachelor of Engineering in Computer Science and Engineering** of the Visvesvaraya Technological University, Belgaum. The Lab report has been approved as it satisfies the academic requirements of the above-mentioned subject and the work prescribed for the said degree.

Dr. Shashikala Associate Professor Department of CSE, BMSCE	Dr. Kavitha Sooda Professor & HOD Department of CSE, BMSCE

## Program 1

**Aim:** Create a topology and simulate sending a simple PDU from source to destination using hub and switch as connecting devices and demonstrate ping messages.

### **Topology , Procedure and Observation:**

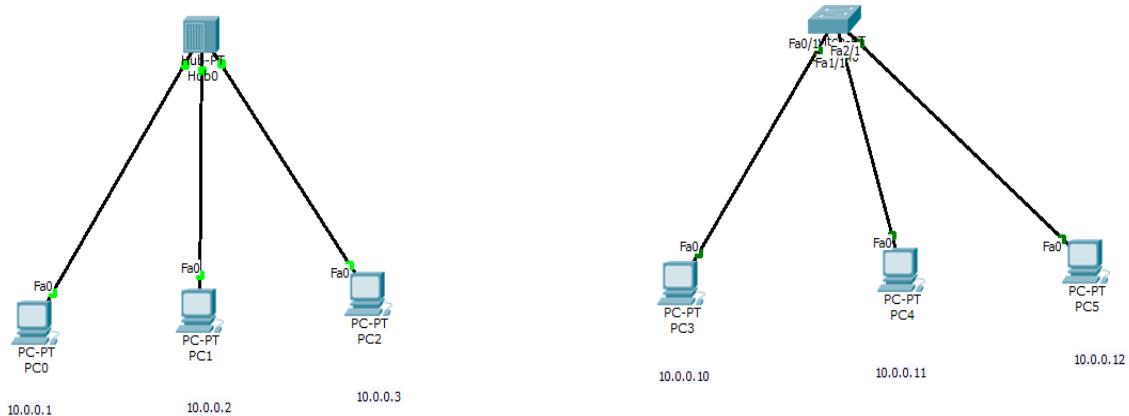

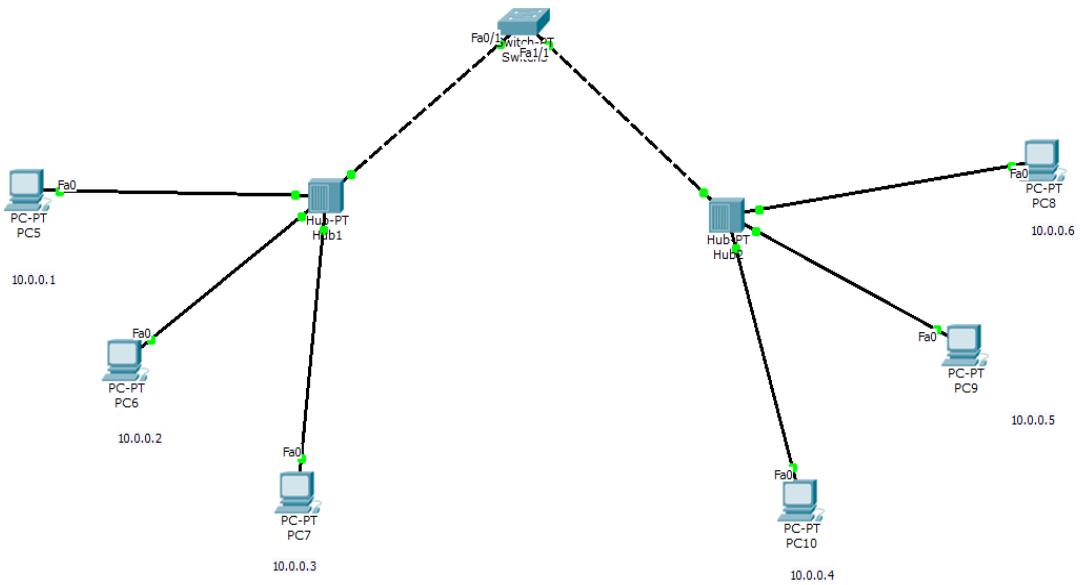

DATE:	PAGE:				
30/10/2024	300				
<p>Difference between Hub and Switch</p> <table border="1"> <thead> <tr> <th>Hub</th> <th>Switch</th> </tr> </thead> <tbody> <tr> <td> <ul style="list-style-type: none"> <li>→ Hub operates at the physical layer (Layer 1) of OSI model</li> <li>→ It broadcasts data packets to all devices regardless of intended recipient</li> <li>→ It is less efficient and supports lower speeds</li> </ul> <p style="text-align: center;">16/10/24</p> </td> <td> <ul style="list-style-type: none"> <li>→ Switch operates at the data link layer (Layer 2) of OSI model</li> <li>→ It broadcasts data packets to specific devices for which data is intended</li> <li>→ It is more efficient and supports higher speeds</li> </ul> </td> </tr> </tbody> </table>	Hub	Switch	<ul style="list-style-type: none"> <li>→ Hub operates at the physical layer (Layer 1) of OSI model</li> <li>→ It broadcasts data packets to all devices regardless of intended recipient</li> <li>→ It is less efficient and supports lower speeds</li> </ul> <p style="text-align: center;">16/10/24</p>	<ul style="list-style-type: none"> <li>→ Switch operates at the data link layer (Layer 2) of OSI model</li> <li>→ It broadcasts data packets to specific devices for which data is intended</li> <li>→ It is more efficient and supports higher speeds</li> </ul>	<p>procedure:</p> <ol style="list-style-type: none"> <li>Select a go</li> <li>connect 2 copper cross</li> <li>configure pc and 10.0.0.</li> <li>Select the router &gt; ex router #1</li> <li>Router (conf)</li> <li>Router (conf)</li> <li>Router (conf)</li> <li>Similarly</li> </ol>
Hub	Switch				
<ul style="list-style-type: none"> <li>→ Hub operates at the physical layer (Layer 1) of OSI model</li> <li>→ It broadcasts data packets to all devices regardless of intended recipient</li> <li>→ It is less efficient and supports lower speeds</li> </ul> <p style="text-align: center;">16/10/24</p>	<ul style="list-style-type: none"> <li>→ Switch operates at the data link layer (Layer 2) of OSI model</li> <li>→ It broadcasts data packets to specific devices for which data is intended</li> <li>→ It is more efficient and supports higher speeds</li> </ul>				

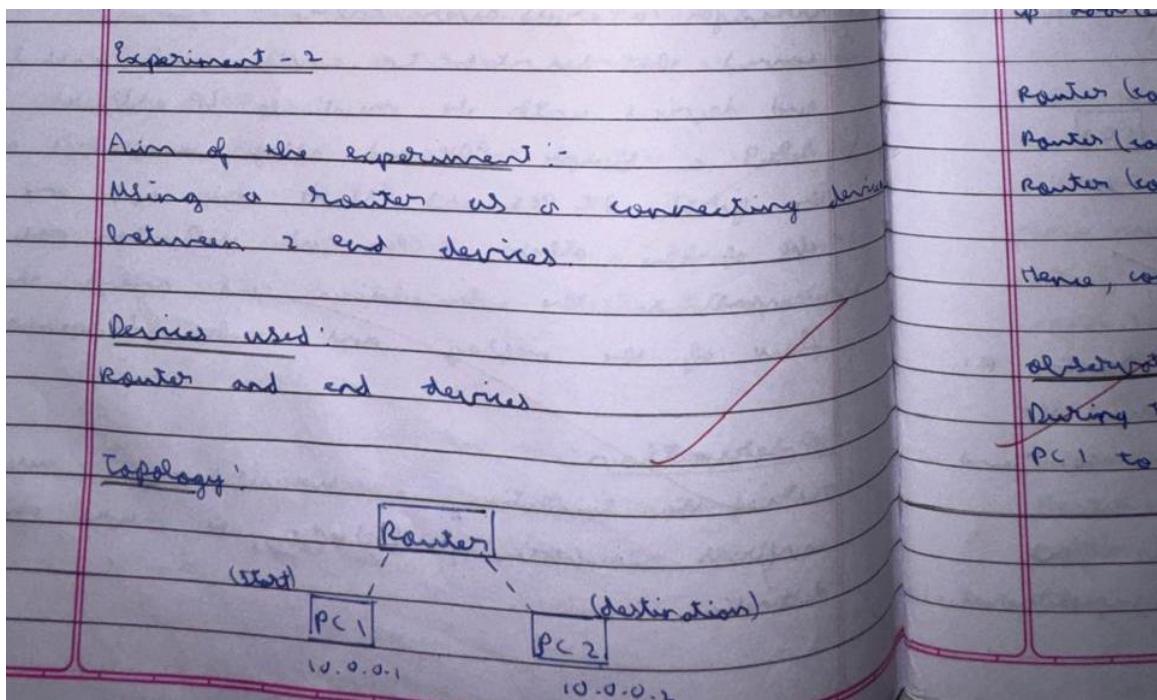

## Screen Shots:

## **Program 2**

**Aim:** Configure IP address to routers in packet tracer. Explore the following messages: ping responses, destination unreachable, request timed out, reply.

### **Topology , Procedure and Observation:**

DATE: PAGE:

procedure:

- (i) Select a generic router R.
- (ii) Connect 2 end devices to the router using copper cross over cables.
- (iii) Configure PC1 and PC2 with IP addresses 10.0.0.1 and 10.0.0.2.
- (iv) Select the router and go to the CLT.

Router > enable

Router # config terminal

Router (config) # interface fastethernet 0/0

Router (config-if) # ip address 10.0.0.1 255.0.0.0

Router (config-if) # no shutdown

Router (config-if) # exit

Similarly do the same for PC2 but set the IP address as 10.0.0.2 this time in the CLT.

Router (config) # interface fastethernet 1/0

Router (config-if) # ip address 10.0.0.2 255.0.0.0

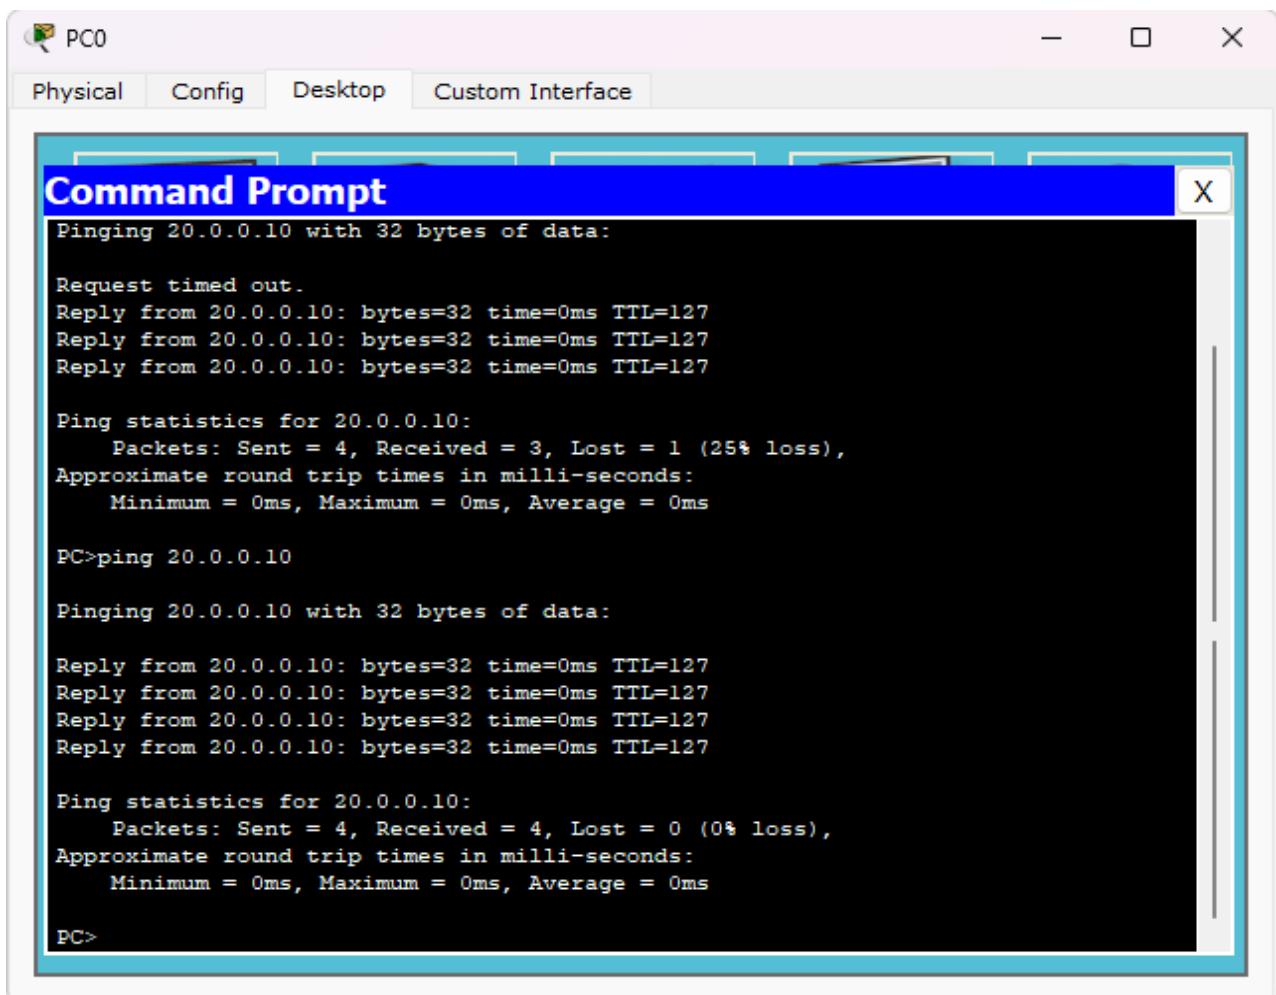

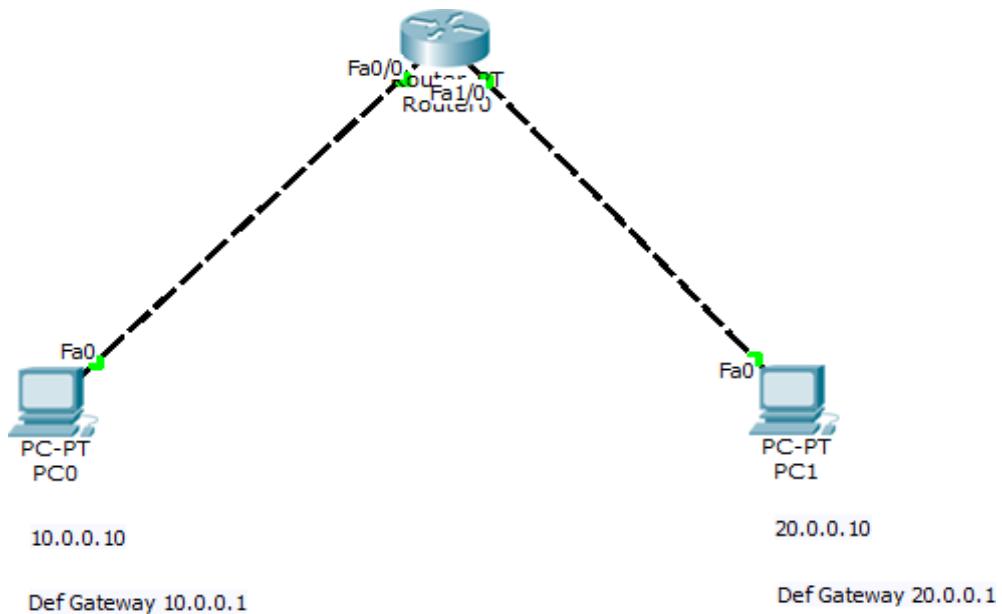

Router (config-if) # no shutdown

Hence, connection between Router and PC is established.

#### Observations:

During the simulation, the message is sent from PC1 to PC2 and acknowledgement is sent back.

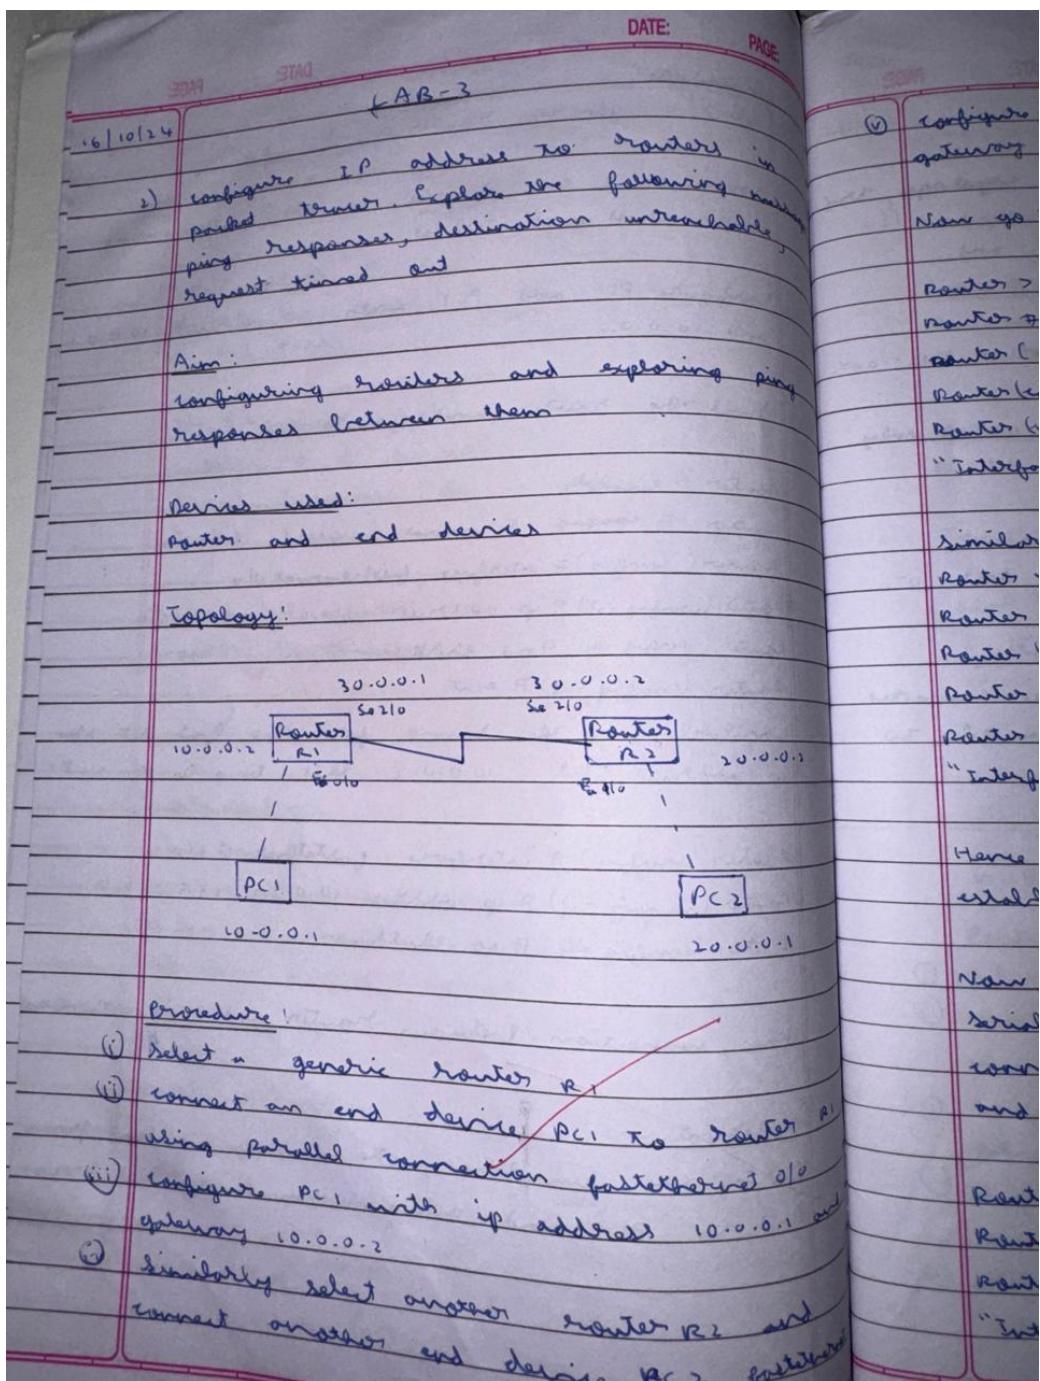

## Screen Shots:

### Program 3

Aim: Configure default route, static route to the Router(Part 1).

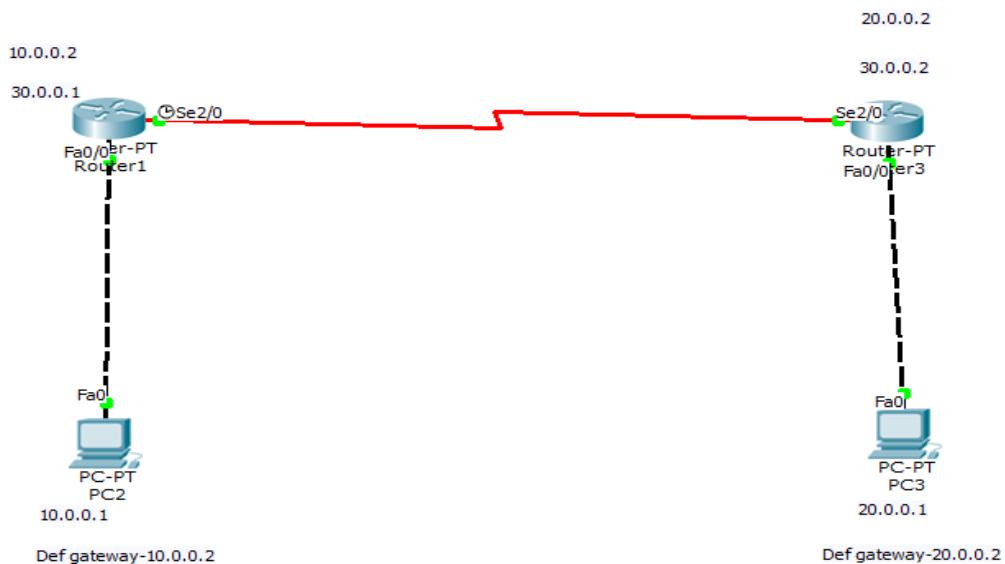

#### **Topology , Procedure and Observation:**

② configure PC with ip address 20.0.0.1 and gateway 20.0.0.1  
 Now go to Router R1 and its CLI and enable Router > enable  
 Router # config terminal  
 Router (config) # interface fastethernet 0/0  
 Router (config-if) # ip address 10.0.0.2 255.0.0.0  
 Router (config-if) # no shutdown  
 "Interface fastethernet 0/0, changed state to up"  
 Similarly, repeat router R2 and go to CLI:  
 Router > enable  
 Router # config terminal  
 Router (config) # interface fastethernet 1/0  
 Router (config-if) # ip address 20.0.0.2 255.0.0.0  
 Router (config-if) # no shutdown  
 "Interface fastethernet 1/0, changed state to up"  
 Hence two connection between Router and switch established  
 Now connect Router R1 to Router R2 using serial cable (initially connected). Need to setup connection between the routers, go to Router R1 and then go to CLI:  
 Router (config) # interface serial 2/0  
 Router (config-if) # ip address 30.0.0.2 255.0.0.0  
 Router (config-if) # no shutdown  
 "Interface serial 2/0 changed state to up"

Observation:  
 After setting up the mentioned topology, to ping PC1 with PC2.  
 Open command prompt for PC1 and type ping 20.0.0.1  
 → Destination unreachable  
 packets sent: 4 received: 0 loss: 4 percent  
 It is also observed that PC1 was able to ping with Router R1.  
 ping 30.0.0.1  
 packets sent: 4 received: 4 lost: 0 percent: 0%  
 This was successful  
 Hence, although the routers were connected serially, the end devices were unable to ping each other  
*21/10/24*

## Screen Shots:

PC2

Physical Config Desktop Custom Interface

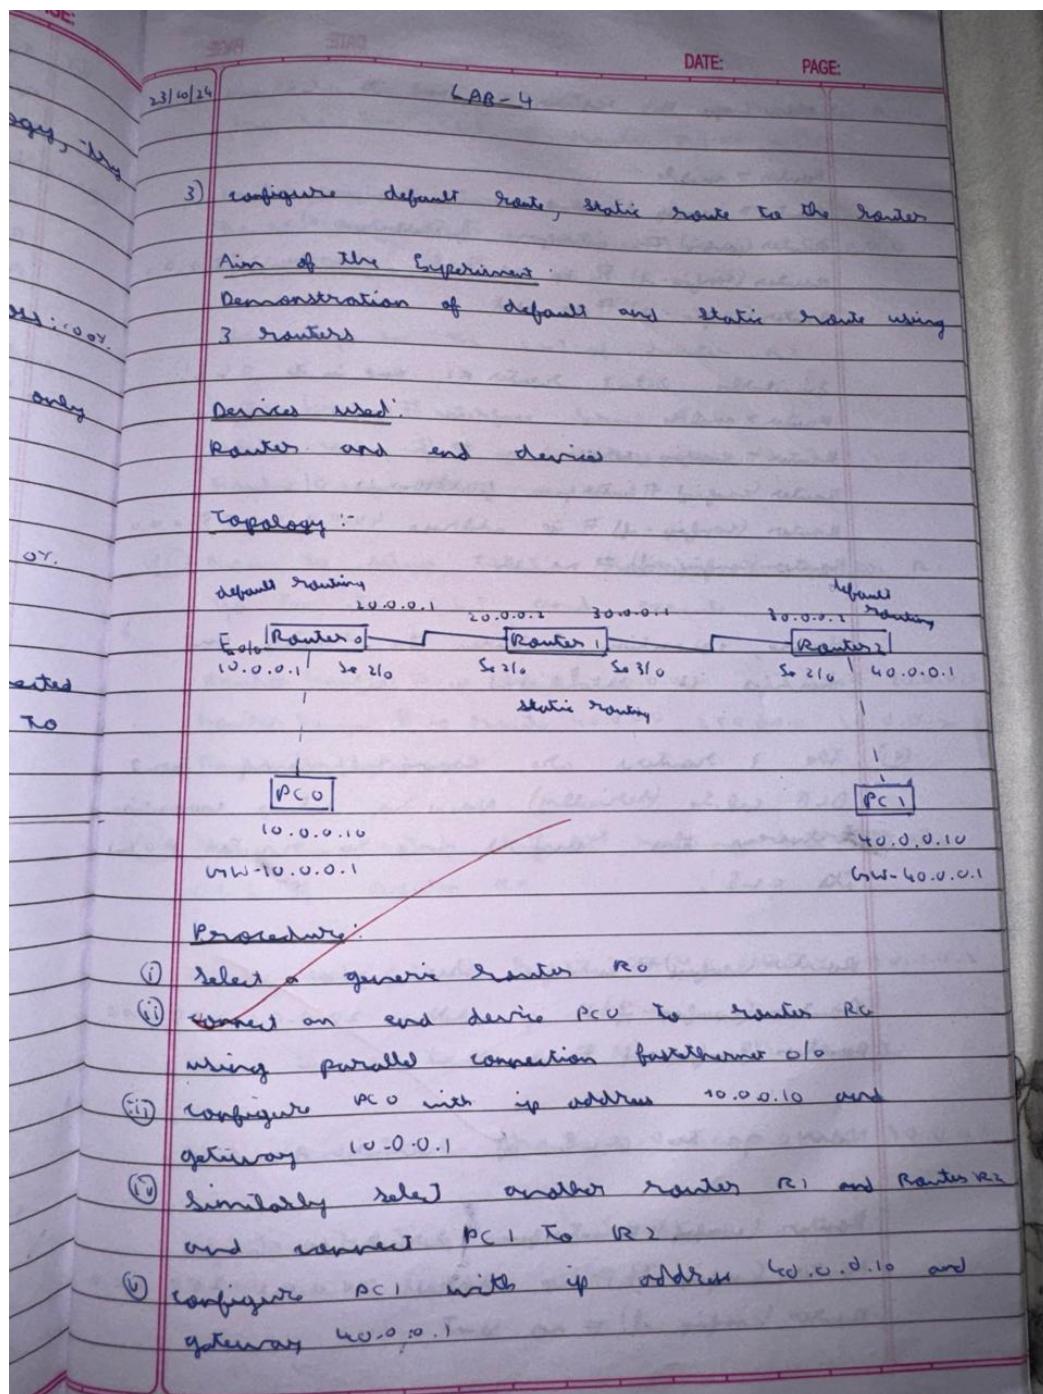

**Command Prompt**

```
Reply from 10.0.0.2: Destination host unreachable.  
Reply from 10.0.0.2: Destination host unreachable.  
Reply from 10.0.0.2: Destination host unreachable.  
  
Ping statistics for 20.0.0.1:  
    Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),  
  
PC>ping 20.0.0.1  
  
Pinging 20.0.0.1 with 32 bytes of data:  
  
Reply from 10.0.0.2: Destination host unreachable.  
  
Ping statistics for 20.0.0.1:  
    Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),  
  
PC>ping 20.0.0.2  
  
Pinging 20.0.0.2 with 32 bytes of data:  
  
Reply from 10.0.0.2: Destination host unreachable.  
  
Ping statistics for 20.0.0.2:  
    Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),  
  
PC>
```

## Program 4

Aim: Configure default route, static route to the Router(Part 2).

### **Topology , Procedure and Observation:**

**QUESTION**

Now go to Router no and its C.R and  
Router > enable  
Router # config terminal  
Router (config) # interface fastethernet 0/0  
Router (config-if) # ip address 1.0.0.10 255.0.0.0  
Router (config-if) # no shut

Similarly select Router R2 and in the CLI  
Router > enable  
Router # config terminal  
Router (config) # interface fastethernet 0/0  
Router (config-if) # ip address 40.0.0.10 255.0.  
Router (config-if) # no shut

Hence, connection between the outer and inner is established.

- (v) The 3 routers are connected using serial DCE cables (serially). Now to setup routes between the routers. In to router R1 its CLB!

~~Router (config) # interface serial 2/0  
Router (config-if) # ip address 20.0.0.1 255.0.0.1  
Router (config-if) # no shut~~

Now go to CLI of router p1

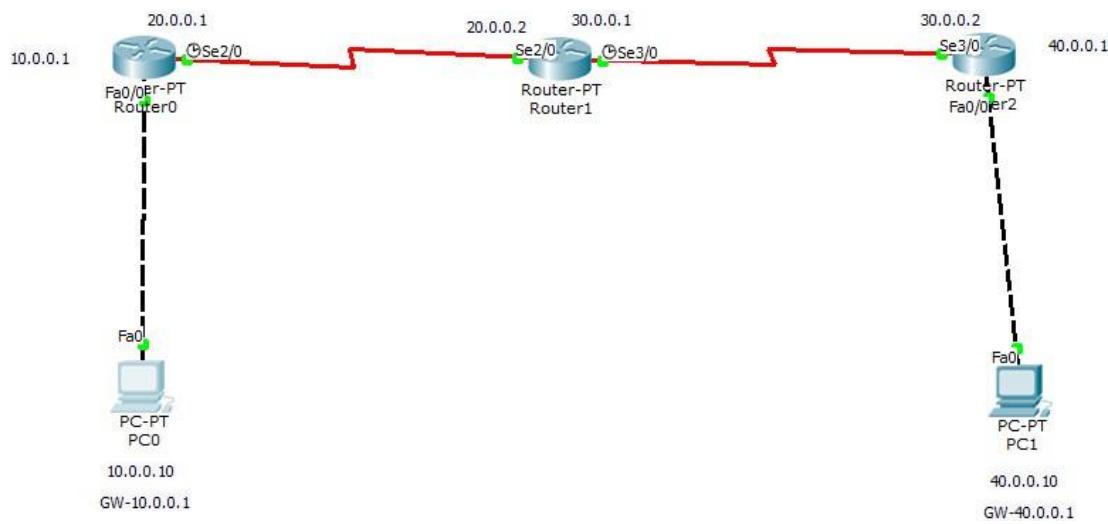

```
Router (config) # interface serial 2/0
Router (config-if) # ip address 20.0.0.2 255.0.0.0
Router (config-if) # no shutdown
```

PAGE: *and*  
 DATE: *30/09*  
 PAGE: *30/09*  
 Now go to Router R1 and Router R2.  
 Go to the CLI of Router R1.  
 Router (config) # interface serial 3/0  
 Router (config-if) # ip address 30.0.0.1 255.0.0.0  
 Router (config-if) # no shutdown  
 Now go to the CLI of Router R2.  
 Router (config) # interface serial 2/0  
 Router (config-if) # ip address 40.0.0.1 255.0.0.0  
 Router (config-if) # no shutdown  
 (vii) Now to setup static routing in Router R1.  
 Go to its CLI and execute:  
 Router (config) # ip route 10.0.0.0 255.0.0.0 20.0.0.1  
 Router (config) # ip route 40.0.0.0 255.0.0.0 10.0.0.2  
 Router (config) # exit  
 (viii) Now to setup default routing. Go to the CLI of Router R0.  
 Router (config) # ip route 0.0.0.0 0.0.0.0 20.0.0.1  
 Now in the CLI of Router R2 execute:  
 Router (config) # ip route 0.0.0.0 0.0.0.0 30.0.0.1  
 Default routing is now setup

PAGE: *30/09*  
 DATE: *30/09*

## Program 9

Aim: Configure Web Server, DNS within a LAN.

### **Topology , Procedure and Observation:**

DATE: \_\_\_\_\_  
PAGE: \_\_\_\_\_  
3791 3792  
LAB-3

Now to demonstrate Web server and DNS within a LAN.

Devices used:  
Router, PC, Server

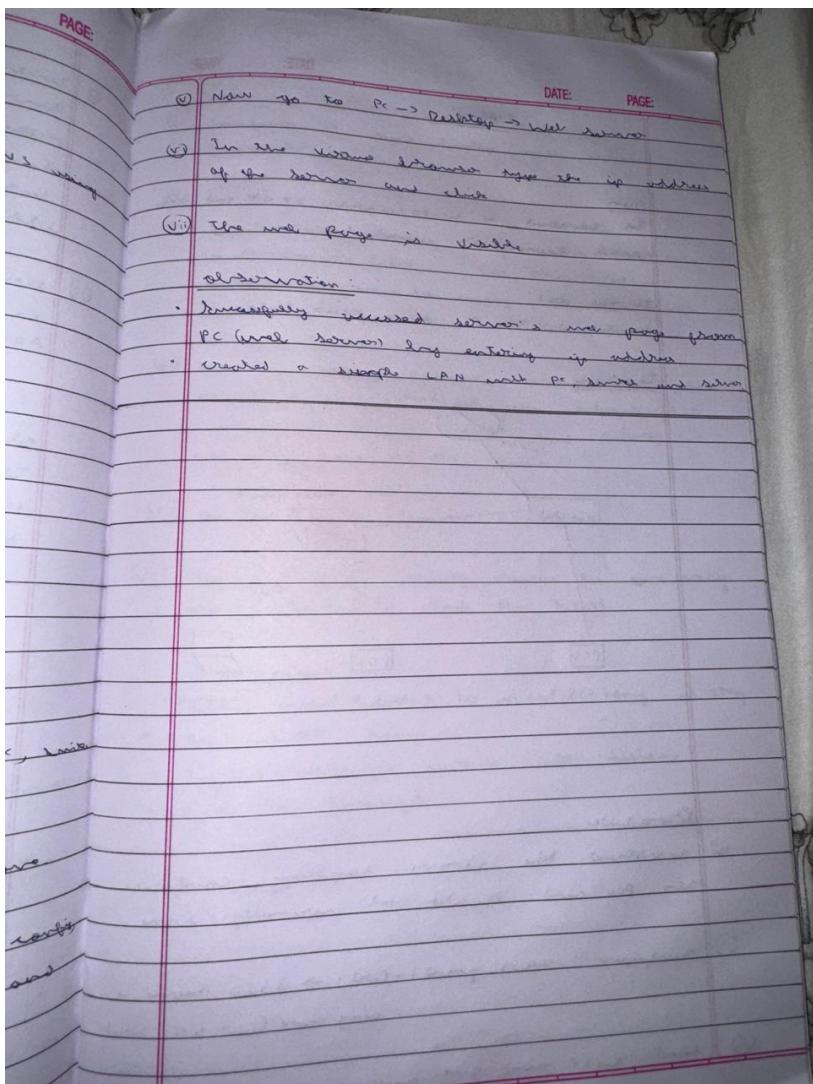

Topology:

```
graph LR; PC[PC] --- Router[Router]; Router --- Server[Server]
```

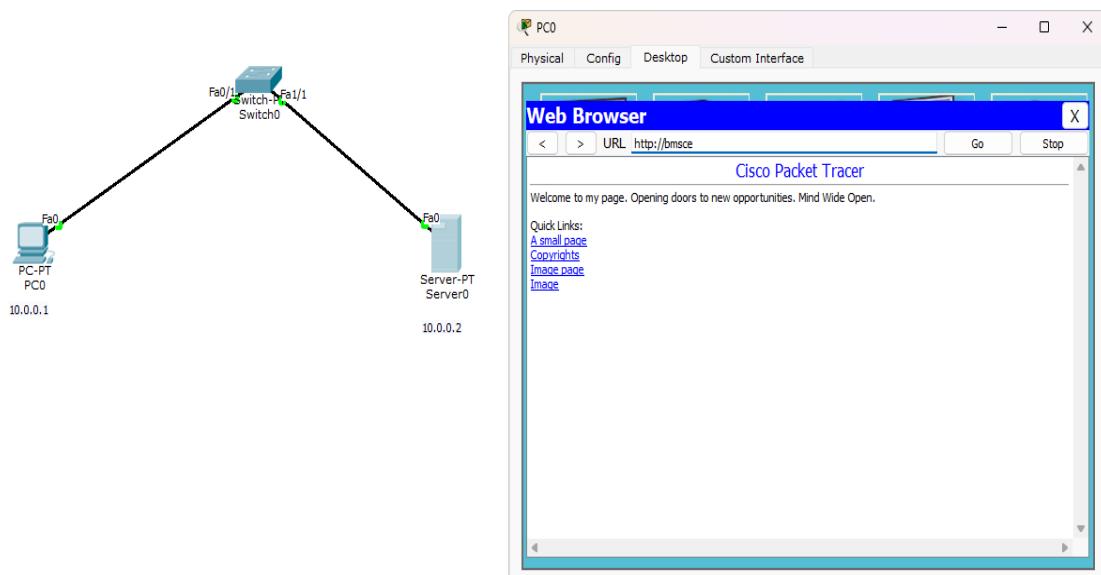

The diagram illustrates a simple network topology. A computer labeled "PC" is connected to a "Router". The Router is also connected to a "Server". The IP address of the PC is listed as 10.0.0.1, and the IP address of the Server is listed as 10.0.0.2.

Procedure:

- (i) Create the above topology using PC, Router and server.
- (ii) Set the IP address of PC as shown above.
- (iii) To set IP address of server, go to and select static method, set IP address and make sure port status is on.
- (iv) Ping server from PC (ping is successful, 0% loss).

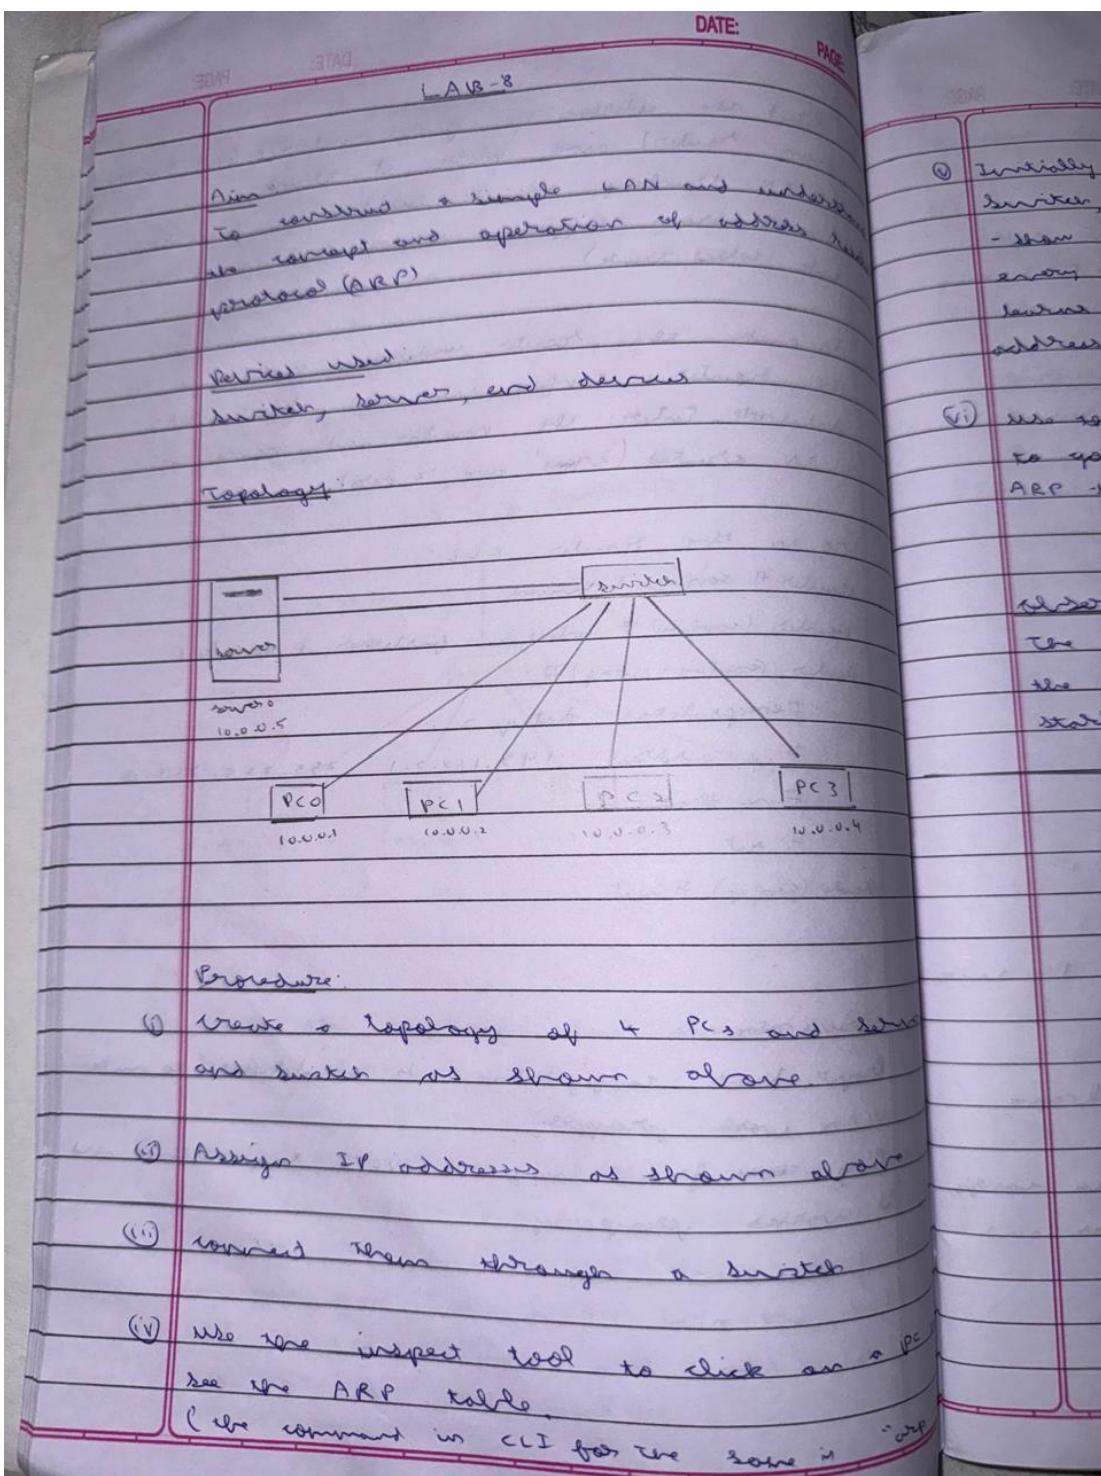

## Screen Shots:

## **Program 10**

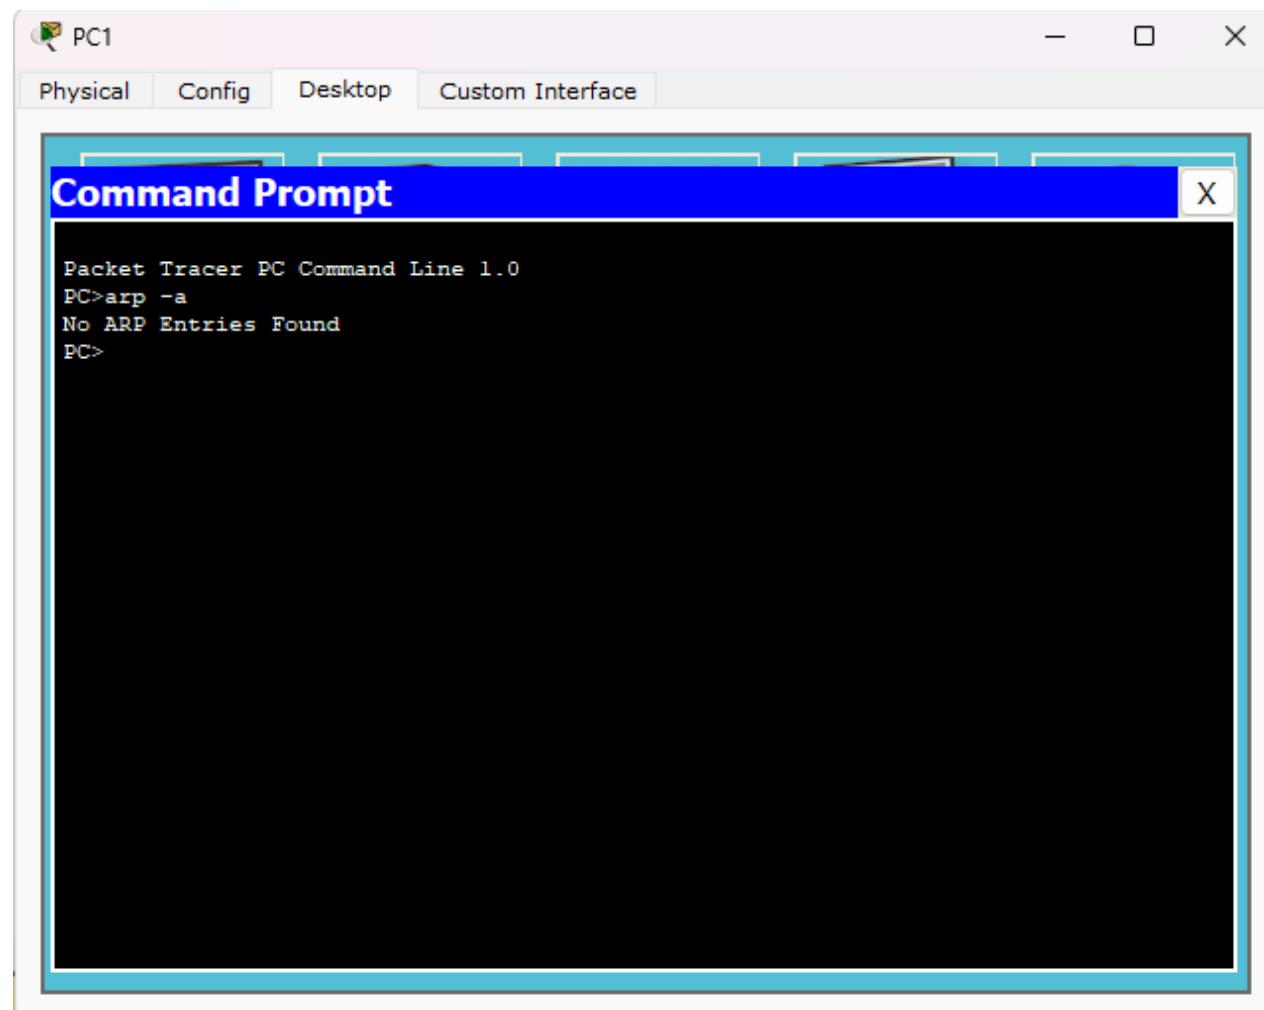

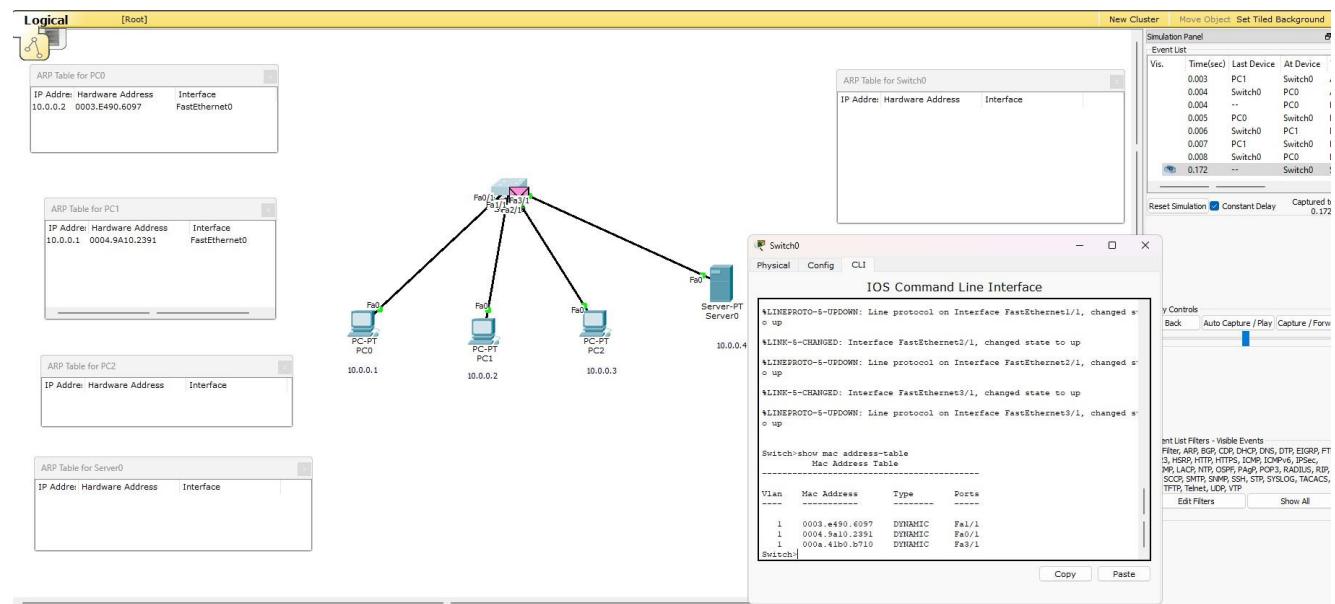

**Aim:** To construct simple LAN and understand the concept and operation of Address Resolution Protocol (ARP)

### **Topology , Procedure and Observation:**

- TOP STAG
- DATE: PAGE:
- Observations:
- (i) Initially ARP table is empty. Also in C/I of services, the command - show mac address-table can be given and every transaction to see the entries learned from transactions and builds up address table.
- (ii) Now the capture button is simulated and to go step by step so changes in the ARP table can be clearly seen.

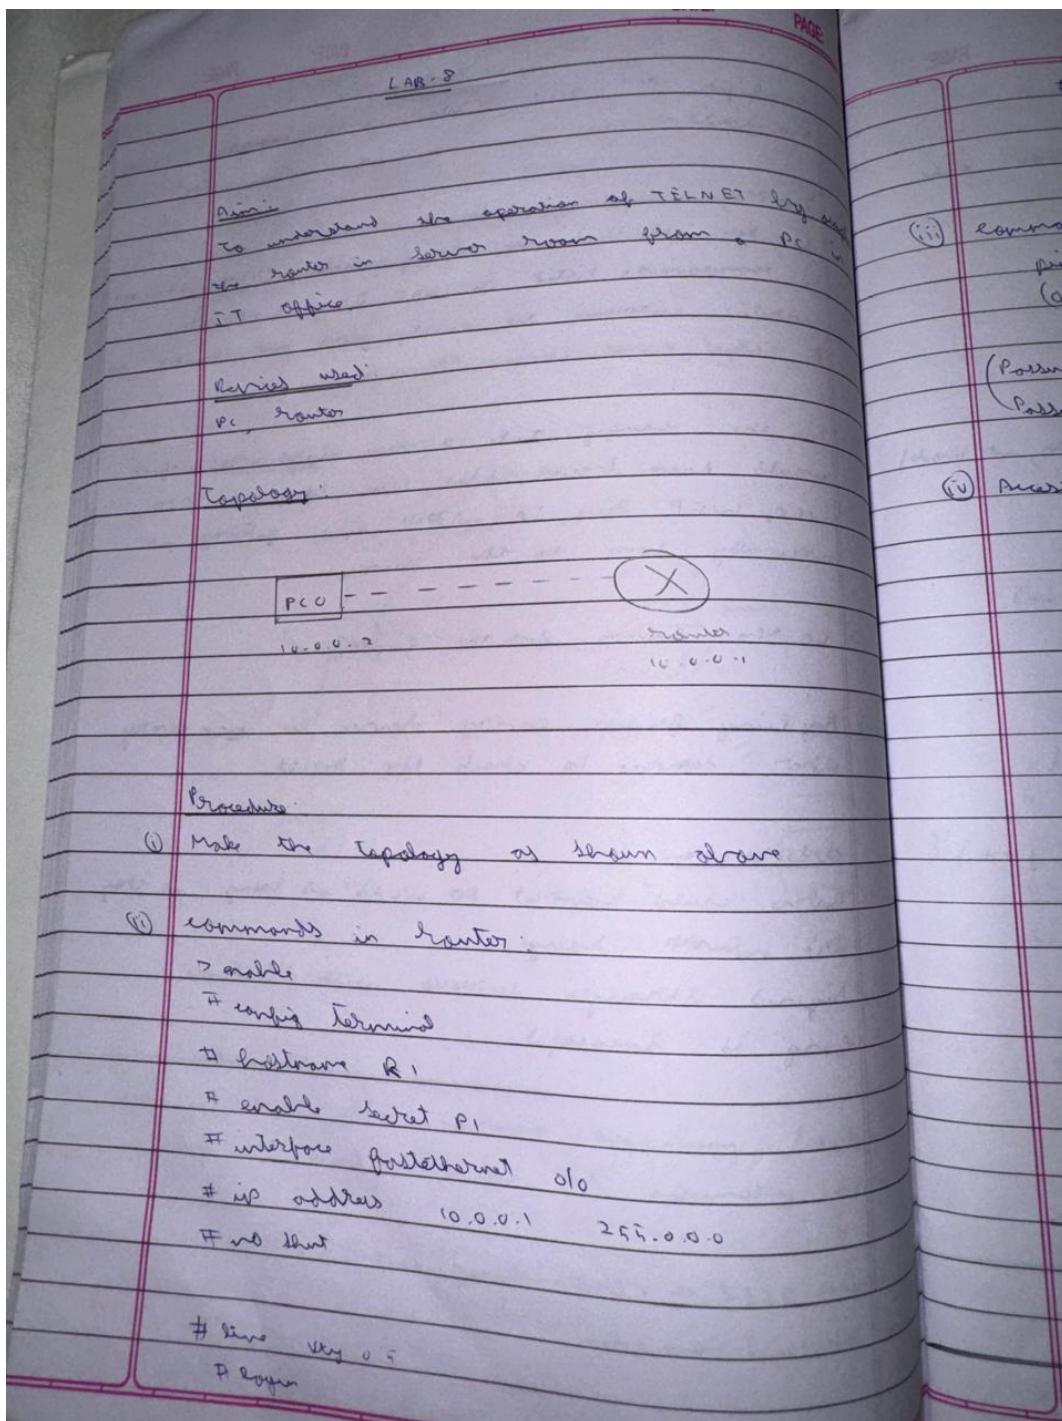

## Screen Shots:

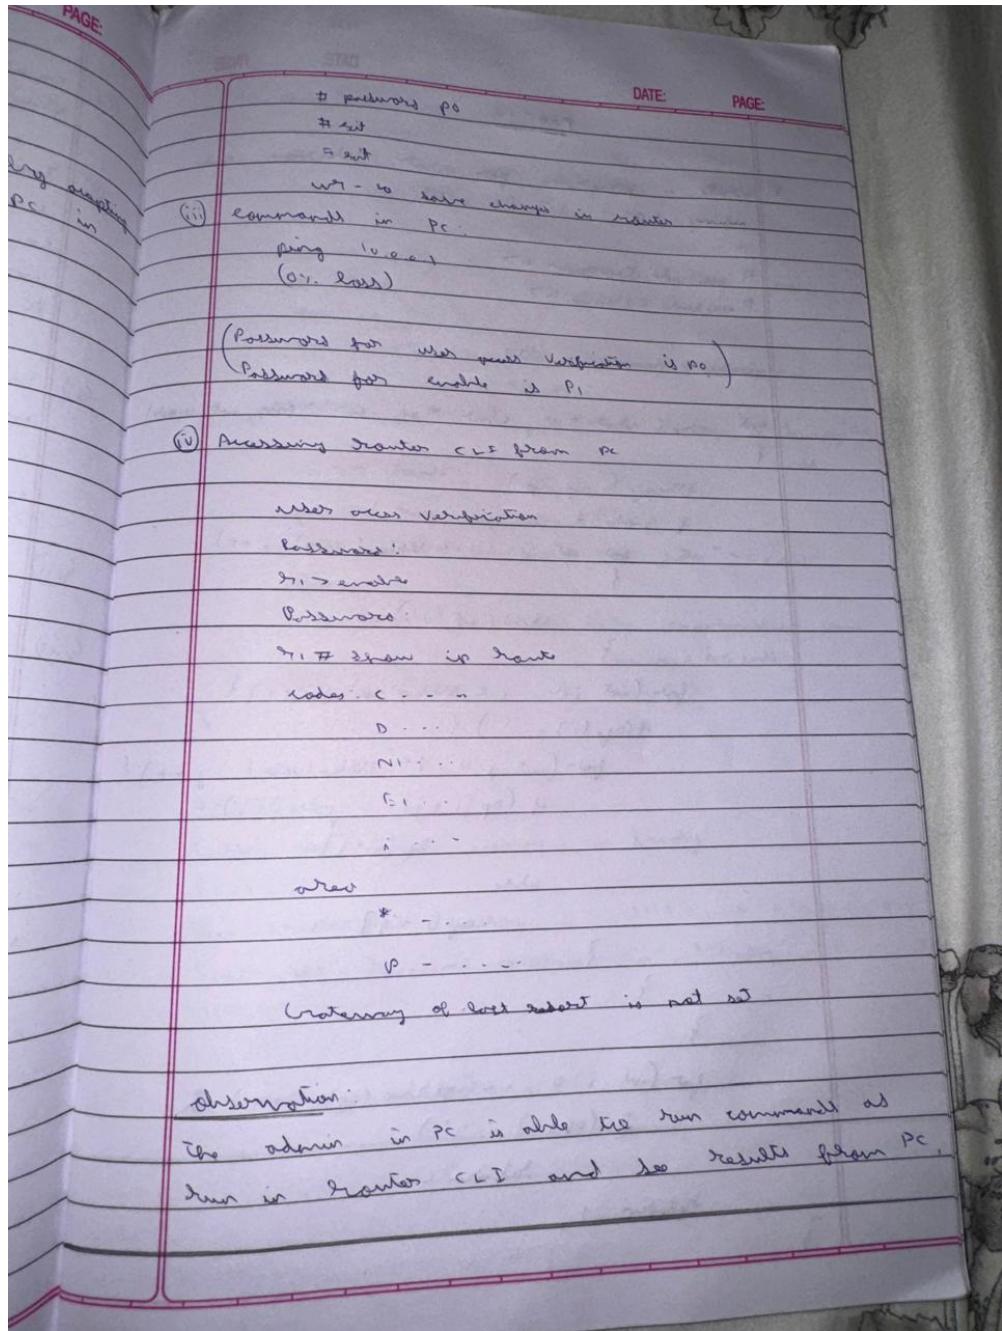

## **Program 11**

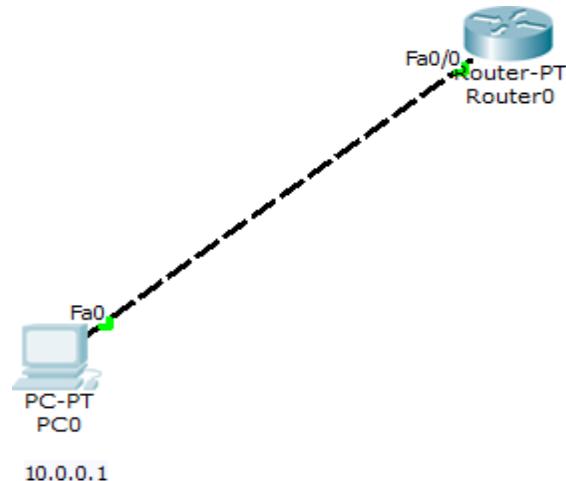

**Aim:** To understand the operation of TELNET by accessing the router in the server room from a PC in the IT office.

### **Topology , Procedure and Observation:**

## Screen Shots:

10.0.0.1

### Command Prompt

```
Packet Tracer PC Command Line 1.0
PC>ping 10.0.0.2

Pinging 10.0.0.2 with 32 bytes of data:

Reply from 10.0.0.2: bytes=32 time=0ms TTL=255

Ping statistics for 10.0.0.2:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 0ms, Maximum = 0ms, Average = 0ms

PC>telnet 10.0.0.2
Trying 10.0.0.2 ...Open

User Access Verification

Password:
R1>enable
Password:
R1#show ip route

C    10.0.0.0/8 is directly connected, FastEthernet0/0
R1#
```

## Program 12

**Aim:** To construct a VLAN and make the PC's communicate among a VLAN.

### **Topology , Procedure and Observation:**

(iv) Select the interface in fastethernet 4/1 (not switch from router) and make it trunk.  
 (VLAN Trunking allows switches to forward frames from different VLANs over a single link called Trunk)

(v) To make the router understand VLAN, go to the router's config tab and select VLAN database. Enter the number and name of VLAN created ('1' and 'is here').

(vi) Go to the Router CLI.

Router # config terminal

Router (config) # interface fastethernet 4/0/0.1

Router (config-subif) #

# encapsulation dot1q 2

# ip address 192.168.2.1 255.255.255.0

# no shut

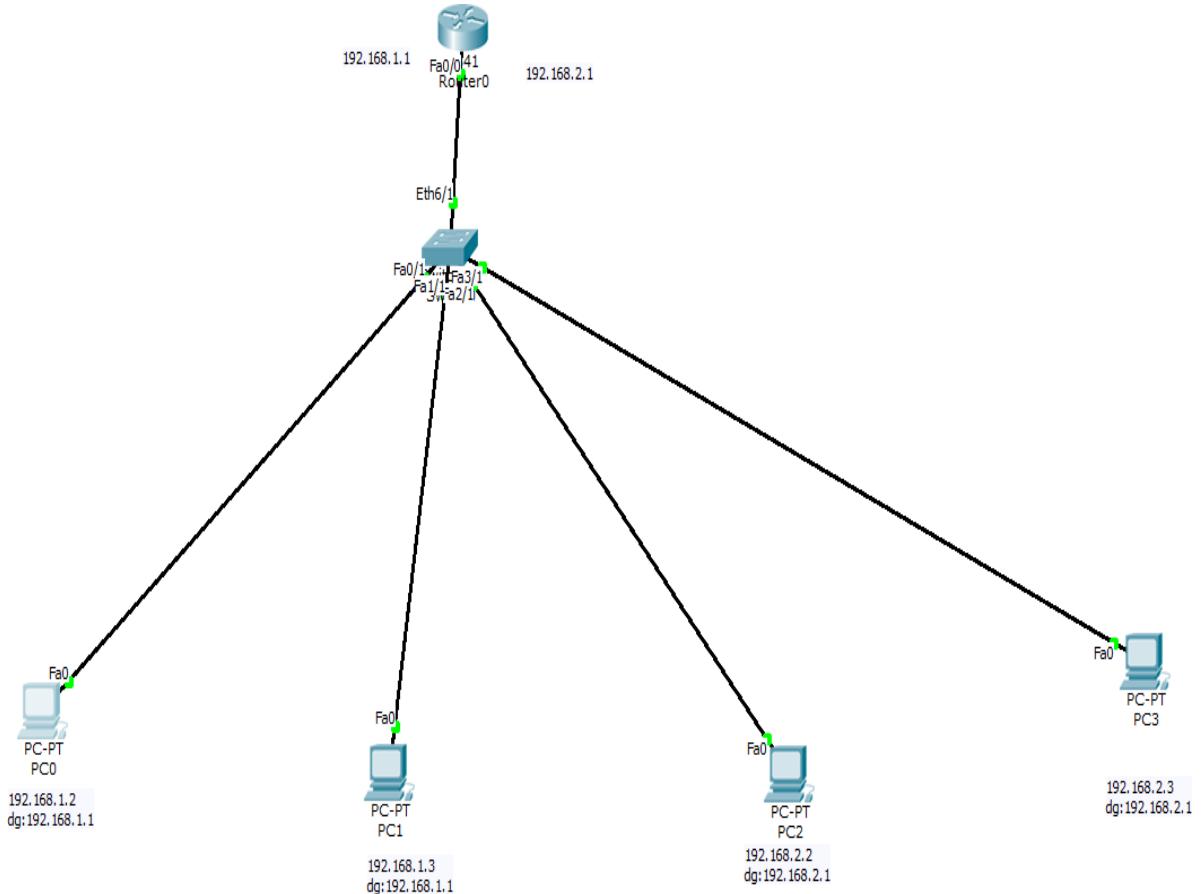

# exit

Router (config) # exit

#### Observation:

- Proper trunk configuration is established to make VLAN work properly
- Ping ~~seen~~ from any one VLAN to another and it works properly.

## Program 13

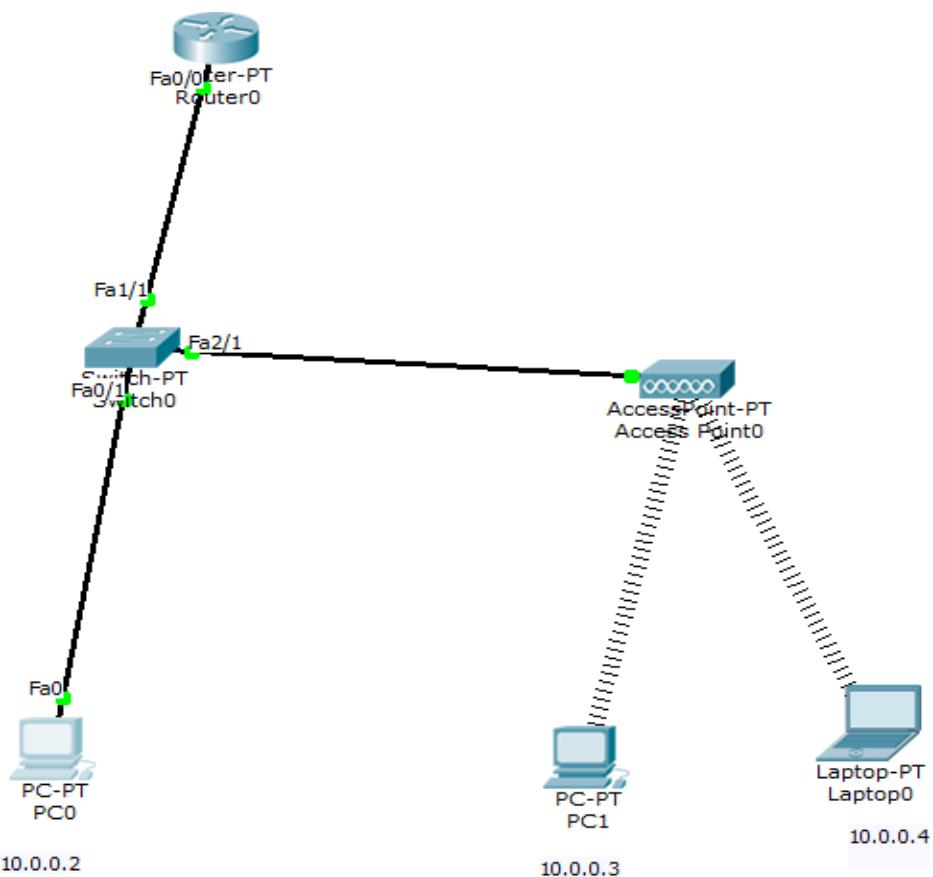

**Aim:** To construct a WLAN and make the nodes communicate wirelessly.

### **Topology , Procedure and Observation:**

- SOME  
SDC
- DATE: \_\_\_\_\_ PAGE: \_\_\_\_\_
- (iv) Configure PC 1 and laptop with wireless interface standards.
  - (v) In PC 1, switch off device, drag existing PI-HOST-NM-1AM to components listed in LHS. Drag WMP20N wireless interface to empty port and switch on PC.
  - (vi) In the config tab, a new wireless interface would have been added. Now configure SSID, WEP, WEP key, IP address and gateway as normally done to the device.
  - (vii) Do the same for the laptop.
  - (viii) Booting from every device to every other device to check the result.
- Observations:
- Device could connect to WLAN as long as they are network range.
  - Signal strength decreased with distance.
  - Boot is successful.

## PART-B

### Program 14

Write a program for error detecting code using CRC-CCITT (16-bits).

#### Code and Output:

```

int main()
{
    char ip[50], op[50], hexa[50];
    char poly[] = "1000100000100001";
    cout << "Enter input message in binary" << endl;
    cin >> ip;
    XOR(ip, op, poly, 1);
    cout << "The transmitted message is:" << op <<
        op + strlen(ip) << endl;
    cout << "Enter the received message in binary" <<
        endl;
    cin >> recv;
    if (XOR(recv, op, poly, 0))
        cout << "No error in data" << endl;
    else
        cout << "Error in data transmission has
            occurred" << endl;
    return 0;
}

OUTPUT:
Enter the input message in binary
111101
The transmitted message is: 111101101110011011
Enter the received message in binary
111101
no error in data

```

## **Program 15**

Write a program for congestion control using Leaky bucket algorithm.

### **Code and Output:**
